

SOLO STUDENT PROJECT

LM-Comment

Learn how to join the conversation.

Turn a real post into a short writing exercise: study reply examples, reshape one, and decide what to share.

See a good reply.

Make it yours.

Android | On-device OCR | Editable AI examples

The post is interesting. The words do not come.

A small hesitation can end a conversation before it begins.

A FAMILIAR MOMENT

I knew I wanted to reply.
I just could not find the words.

People are rarely taught how to write a thoughtful response.

That pause can become:

- **Less practice**
Writing stays difficult when every uncertain moment is avoided.
- **Less participation**
A perspective never reaches the people who might value it.
- **A missed connection**
One thoughtful comment can be the start of a new community.

The gap is often practice, not a lack of ideas.

A reply becomes a tiny writing lesson.

The learner observes, compares, rewrites, and stays responsible for the final words.

01 Find

Open something you genuinely want to answer.

02 Select

Crop only the useful part of the screen.

03 Check

Review local OCR and correct the text.

04 Compare

Study up to three response examples.

05 Rewrite

Edit, replace, or write one from scratch.

06 Apply

Copy it, then decide whether to post.

Generated replies are worked examples, not measured learning outcomes.

Four actions. One continuous learning flow.

The secure workflow is a normal Android activity. Only the compact lens floats over other apps.

THE BUILD

Pixels stay on the phone. Reviewed words cross the boundary.

Privacy is part of the architecture, not a promise added at the end.

The details had to feel invisible to the learner.

Each fix protected the simple promise: tap, learn, rewrite, copy.

01

Consent overlay

WHAT WORKED

Measured frame transitions and a committed capture cloak prevent the Android permission window from entering the accepted frame.

02

Bubble behavior

WHAT WORKED

True edge snapping, stored position, and a bottom drag-to-close target make the lens behave like a familiar system bubble.

03

Model retirement

WHAT WORKED

A server-side fixed model keeps provider changes and the Groq key outside the mobile source and APK.

Capture resources close on every terminal path. The app never relies on a fixed hide delay.

THE RESULT

A working Android prototype, not just a concept.

The judge path is built, signed, deployed, and backed by repeatable evidence.

107

native Android tests

19

relay tests

1,301

APK entries scanned

0

provider secret hits

Learning stays with the person.

LM-Comment offers a starting point. The learner still chooses the context, rewrites the response, and owns the final words.

Next, I want to learn from real learners.

- **Test the teaching loop**
Observe where examples help and where clearer guidance is needed.
- **Explain the craft**
Show why a response works, not only what to write.
- **Broaden access**
Explore multilingual practice and stronger accessibility.
